

Testimony of Dr. John Nenniger

Congress of the United States
House of Representatives
Committee on Energy and Commerce
Calgary, AB

March 20, 2012

- In lab tests, N-Solv oil rate at 40C is 3x faster than SAGD at 230C

n-solv
Corporation

Key Features

- 85% reduction in temperature (energy)
- No water
- Reduces Well to Tank GHG's by 93 kg/bbl
- Increases oil value 23%
- Reduces Capex and Opex by 30+%
- 2x netback of steam (profit/bbl oil)
- 3x capital efficiency of steam (profit/Capex)
- Access to 1300 billion bbls of stranded bitumen
- Understated economics

N-Solv Economics

SAGD Coker Shrinkage

100 kg Synthetic Crude

23 kg coke
*waste sent
to landfill*

SAGD Coker Shrinkage

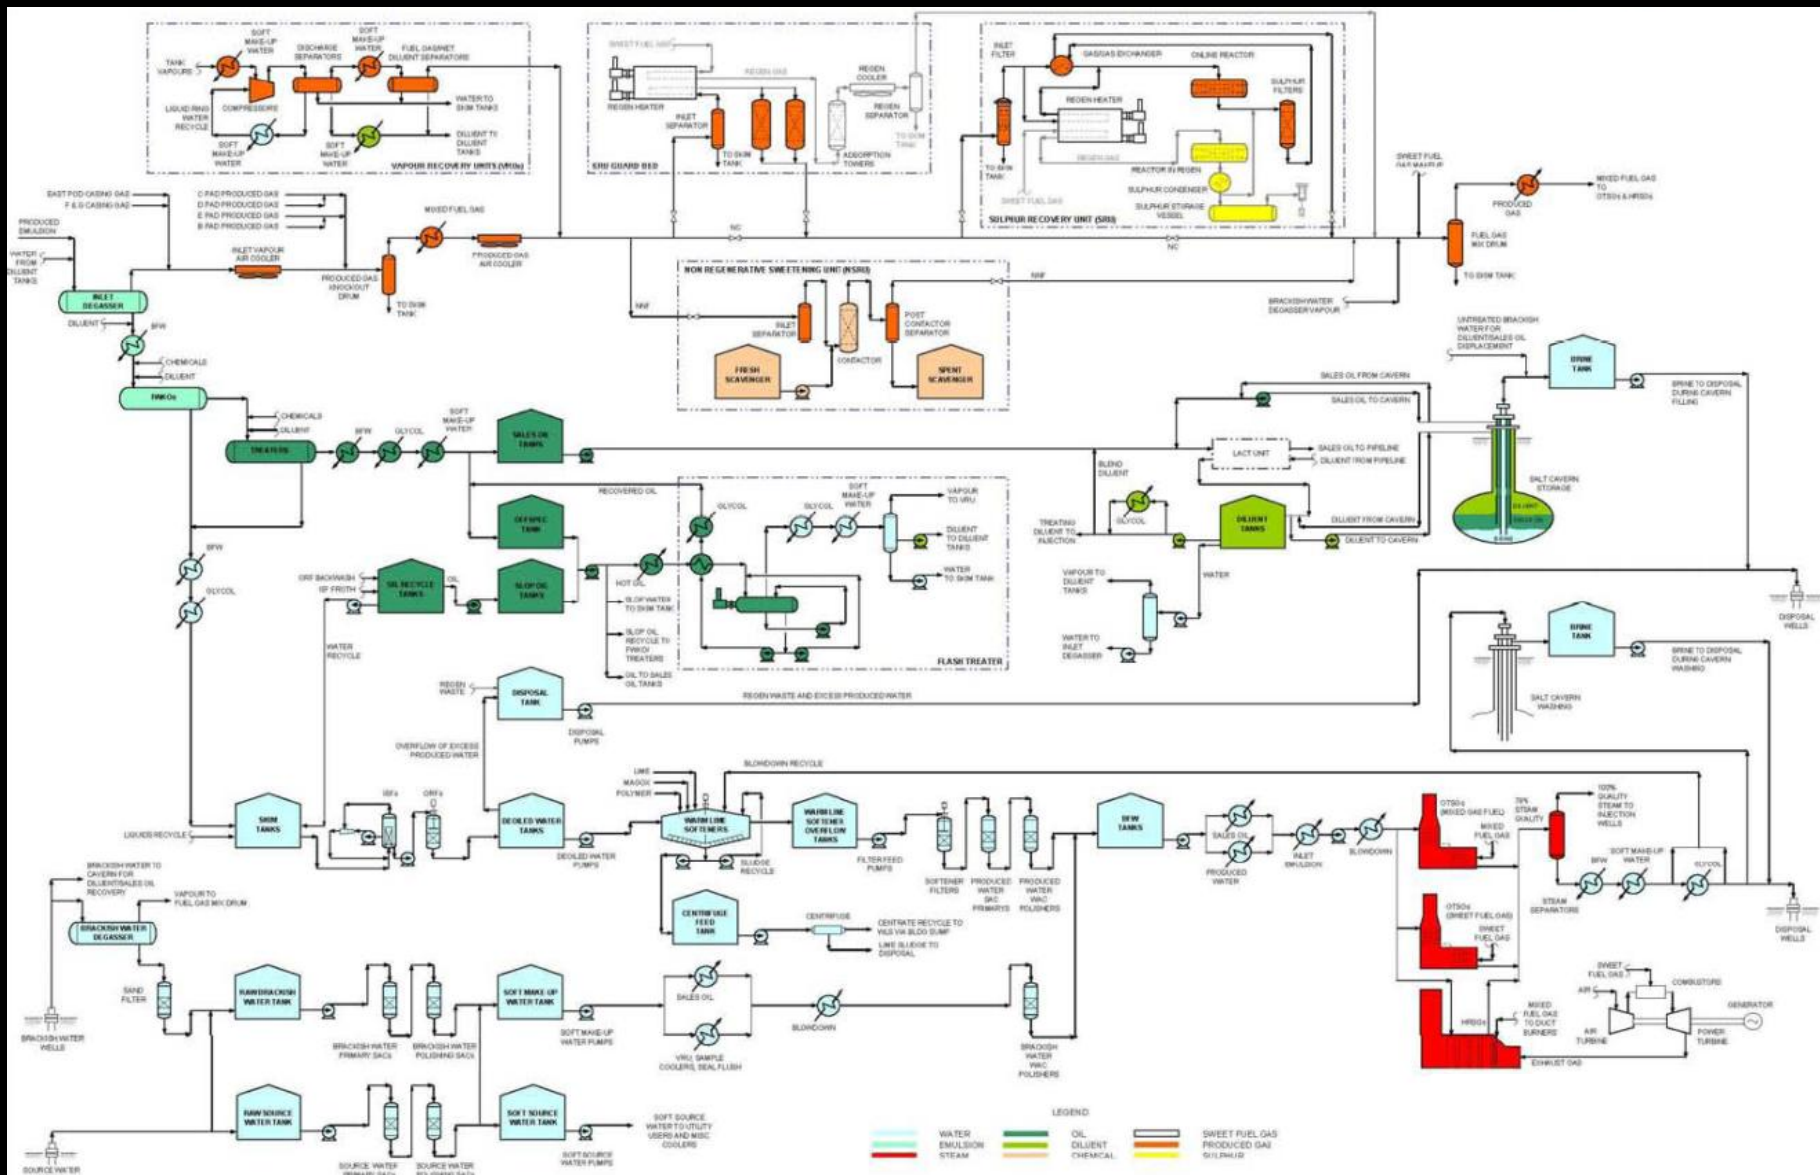

100 kg Synthetic Crude

- N-Solv eliminates the shrinkage
- ➔ A higher yield of refined products
- ➔ N-Solv oil is 23% more valuable

23 kg coke
~~went to landfill~~

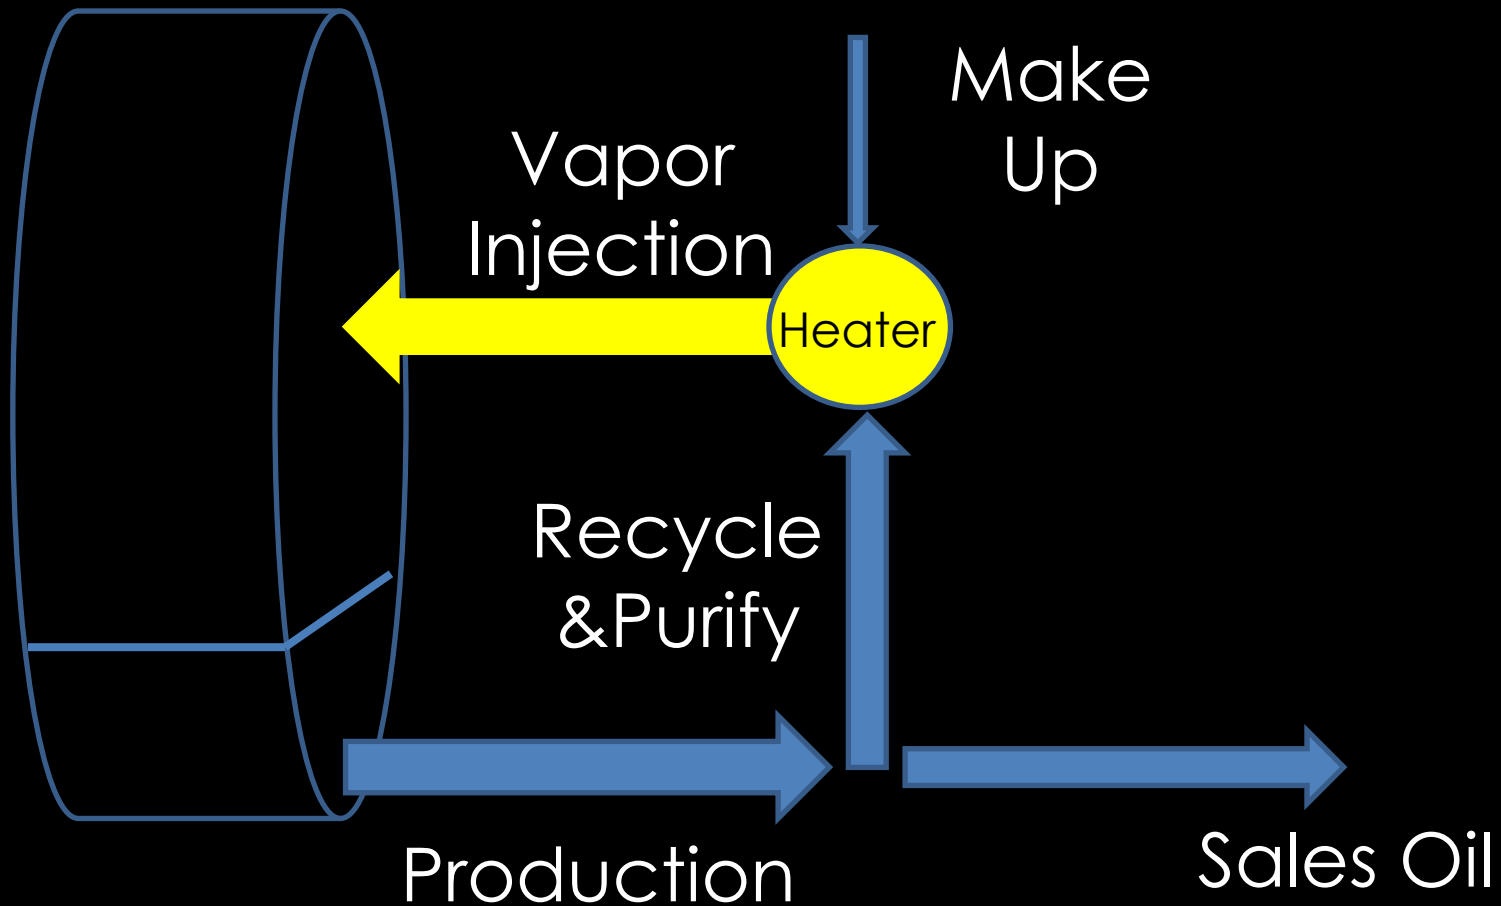

SAGD Process Flowsheet

Eliminate Steam to Cut CAPEX & OPEX

Solvent Loop

- Steam holdup in SAGD is 10% (0.1 bbl / bbl oil)
- If solvent holdup is 20% → solvent cost ~\$7/bbl oil

N-Solv Economics

Strong economics drive adoption

N-Solv Economics

Strong economics drive adoption

Business Case is Understated

- Assumes oil rates are 35% of the lab measured rates
- Assumes solvent holdup is 2x that of water in SAGD
- Assumes no debt leverage
- Assumes “stick built”, but a modular plant design would provide substantive cost savings

N-Solv Environmental

Well to Tank: GHG Emissions

93kg CO₂e reduction per barrel

N-Solv Rollout

Status: Pilot

Time to First Oil

Subsurface Status

- Horizontal Wells
 - Designs complete
 - Subsurface lift system and instrumentation specified
 - Start-up models and hydraulic studies complete

Reservoir

The Science

Oil or Tar or ??

Liquid-Liquid Diffusion

Edge

Liquid-Liquid Diffusion

Figure 6. Propane concentration in bitumen at 775 d.

Dissolution of Bitumen

- Time series showing a layer of bitumen sandwiched between 2 glass slides and submerged in hexane solvent

→ Looks like an ice cube melting

→ Dissolution is confined to a very thin zone (200 μm)

Increasing Time (24 hour interval) →

From Nenniger and Dunn, "How fast is solvent based gravity drainage?" CIPC paper 2008-139

Immobilized Asphaltenes

shock front is about
100 μm deep

Unextracted Bitumen

*An N-Solv experiment showing the
interface between extracted and the
un-extracted zones*

Why Fuss?

- Reservoir model **predict** solvent penetrates **30m** into bitumen
 - N-Solv lab study measured **0.0001m**
- **300,000 fold discrepancy**
- **Significance?**

Solvent Based Gravity Drainage

- Extraction rate is controlled by the bitumen viscosity
 - 30C temperature rise drops bitumen viscosity by 100 fold
- ➔ Can achieve SAGD rates with 1/8th of the energy or GHG requirement

Solvent Based Gravity Drainage

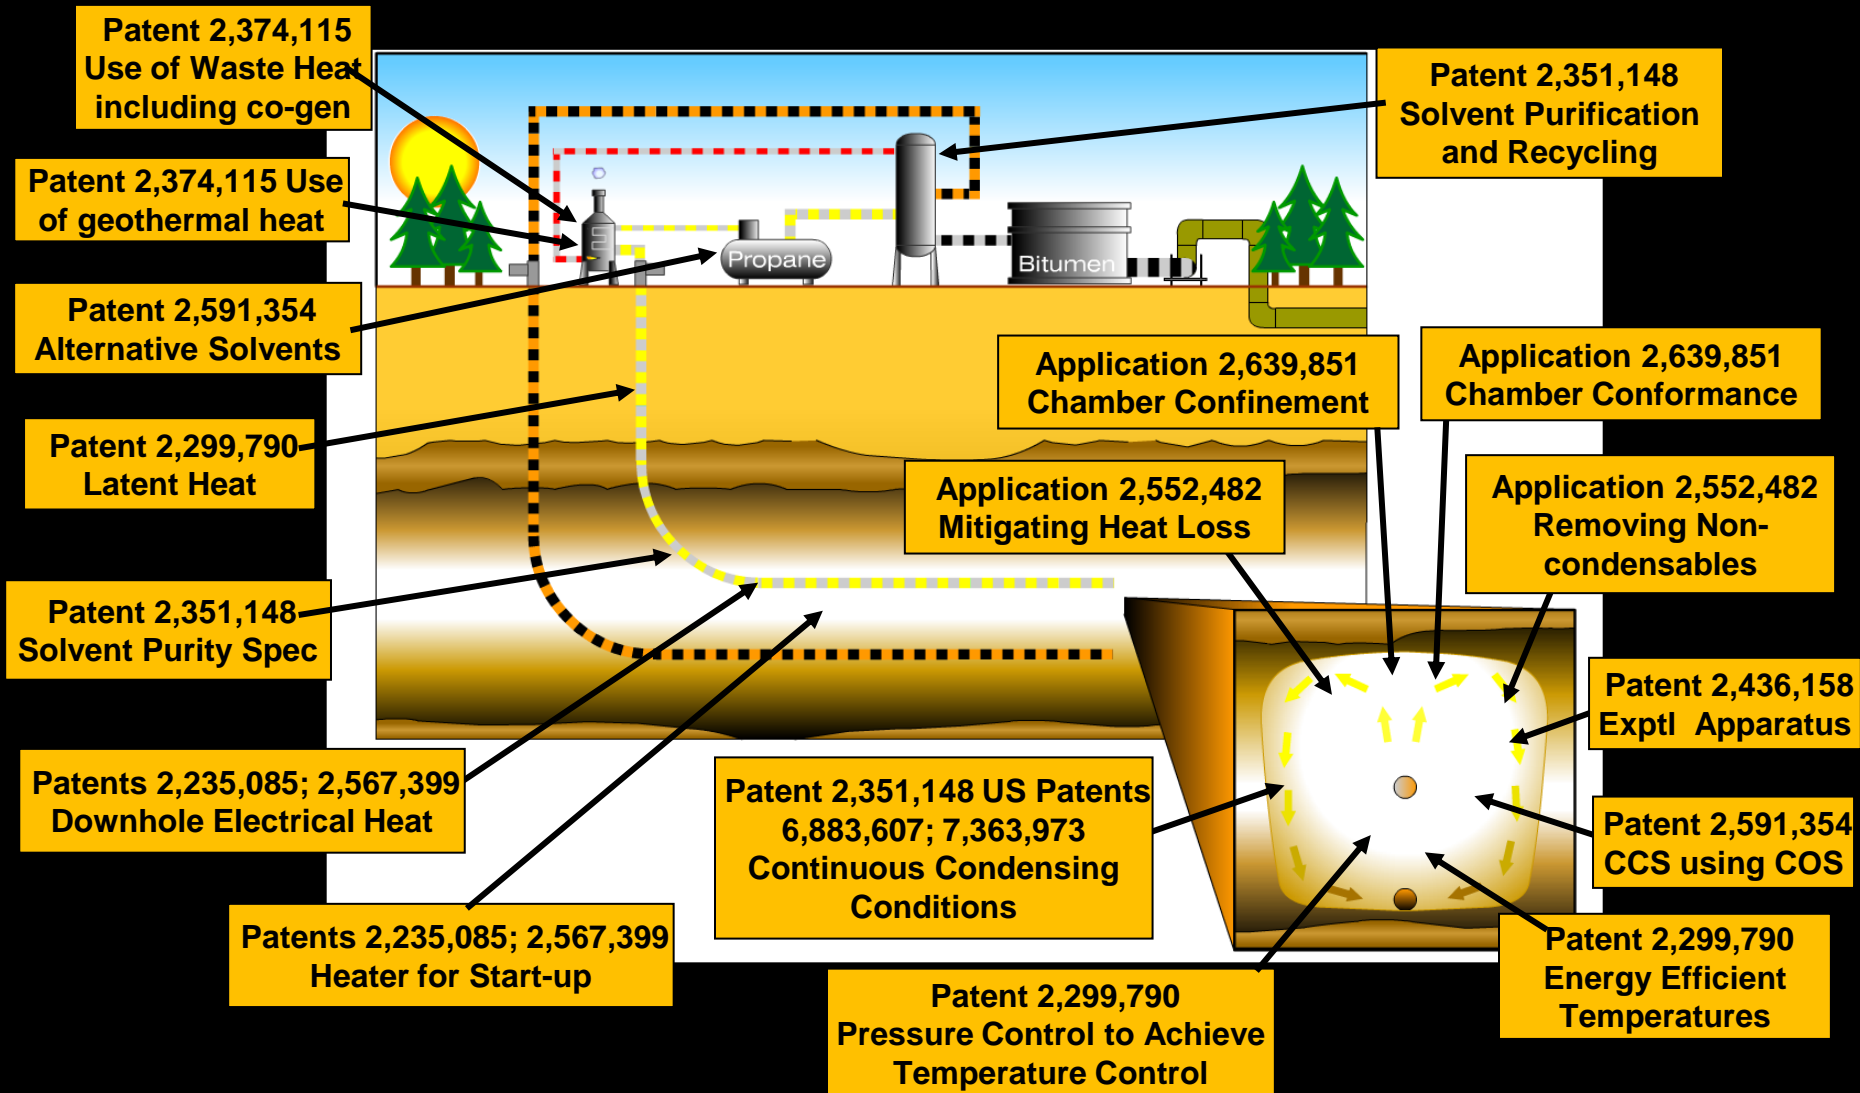

- Since we published our correlation in 2008, the amount of experimental data has almost doubled
- **New data supports the correlation**

Commercialization

Intellectual Property

» ~ 400 IP claims directed towards energy efficient in situ extraction

Stranded Bitumen

Resource	Billions of bbls	Why
No-Man's Land	600	Pressure too low for SAGD
Carbonates	536	Steam/oil ratio too high
Thin Zones	200+	Steam/oil ratio too high
GOB, WOB	<u>???</u>	Cap rock is too fragile for steam induced stresses
Total Stranded Resources	1,300+	

Commercialization

- With a modest market share, the cumulative value add for N-Solv grows rapidly;
- Multiple commercialization options

Summary

- N-Solv offers
 - Strong corporate backing
 - Breakthrough science and technology
 - Twice the netback of SAGD
 - Three times the profit/investment ratio of SAGD
 - Substantive incremental reserves
 - 93⁺kg/bbl reduction in GHG intensity
 - No water consumption
 - Understated economics

Price Elasticity

- How does an oil surplus or deficit affect prices?
 - A civil war in Libya removes 1 million bopd and oil prices will rise \$10/bbl
 - 1 million bopd of new supply (Oilsands, Bakken) will drop oil prices by \$10/bbl
- 1 million bopd of new oil reduces the oil cost for US consumers by \$200million/day (20mbopd x \$10/bbl)
- **A barrel of new oil supply, produced anywhere in the world and sold anywhere in the world saves US consumers \$200!**

Conservation vs New Supply?

- Every barrel saved via conservation saves US consumers \$300 = 100 cost + 200 from price elasticity
- If a barrel of oil costs \$100, the net benefit of any new supply is +\$100/bbl = -100 + 200
- New oil supply is “free money” for consumers, but conservation is really big bucks

R&D Spending as a Share of Sales

Percent

Of all major technology-dependent sectors, the energy sector spends the smallest portion of its sales on research and development. ¹

Little Exxon, tiny Shell

Proven oil and gas reserves, 2010
Billion barrels of oil equivalent

EPA GHG Criteria

- EPA assesses transportation fuel using a well to tank criteria (WTT)
- Current refinery slate in the US has WTT emissions of 99kg CO₂eq/bbl
- AERI/Jacobs Lifecycle Study reports SAGD WTT is 218 kg/bbl
- Mining WTT is 173kg/bbl
- N-Solv WTT is estimated to be 125 kg/bbl with opportunities (co-gen) for improvement
